**Tabla 1: Tratamiento para cardioversión farmacológica**

| Fármacos     | Via      | Recomendación | Evidencia |
|--------------|----------|---------------|-----------|
| Flecainida   | Oral- iv | I             | A         |
| Propafenona  | Oral- iv | I             | A         |
| Amiodarona   | Oral- iv | Ila           | B         |
| Procainamida | iv       | Ilb           | C         |
| Sotalol      | Oral- iv | III           | A         |
| Digoxina     | Oral- iv | III           | A         |

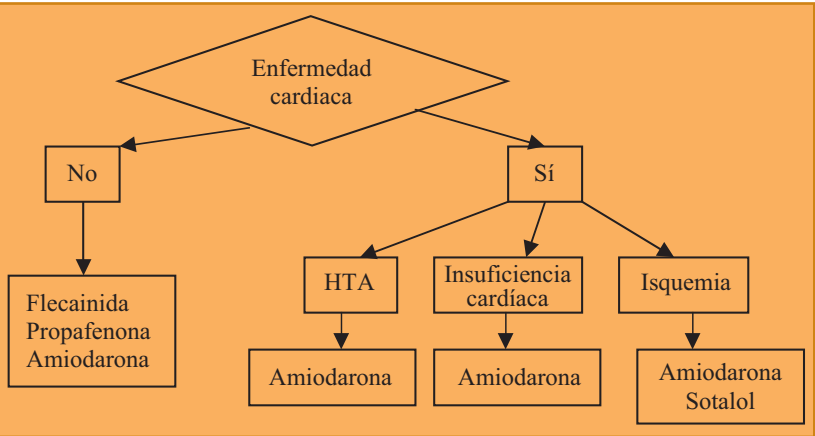

Figura 19. Fármacos recomendados en fibrilación auricular

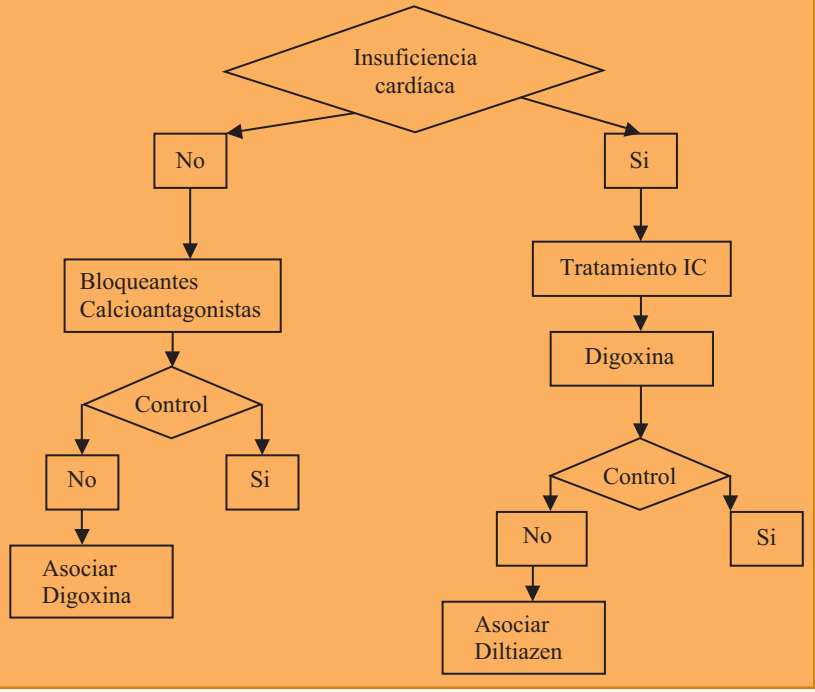

Figura 20. Tratamiento para el control de frecuencia cardíaca

**Tabla 2: Dosis para el control de la frecuencia cardíaca**

| Fármaco     | Fase aguda                                    | Mantenimiento     |
|-------------|-----------------------------------------------|-------------------|
| Diltiazem   | 20 mg iv + 25 mg iv<br>Perfusión 5-15 mg/hora | 180-360 / día     |
| Verapamil   | 5-10 mg iv. en 3 minutos                      | 120-240 / 12-24 h |
| Propranolol | 1-5 mg iv en 5-10 m                           | 30-360 mg día     |
| Atenolol    | 5 mg iv                                       | 50-100 mg / día   |
| Digoxina    | Impregnación                                  | 0,25 mg/día       |
